

About This Document

This document has been designed to give a brief overview of Flexibility, and to give a clear and easy view of how we procure Flexibility Services at National Grid Electricity Distribution. It is aimed at Flexible Service Providers and all Stakeholders.

For more comprehensive detail, please view our in depth document; Guidance for Electricity Distribution Flexibility Service Providers

About Flexibility Services

Flexibility is about reducing loads on the network by using customers' ability to change their usage patterns by either reducing consumption, changing their electricity habits, or (at a larger commercial scale) switching on generators.

Why we need Flexibility;

Managing peak load helps reduce costs to all customers because it means we don't have to invest in a permanent network upgrade to meet a temporary spike in demand.

Flexibility allows us to manage the network when we need to, and make the most of the assets we already have. This will help us deliver a reliable and affordable network as we support the transition to renewables and low carbon generation/technology (Heat Pumps, Electric Vehicles etc.) to hit the UKs net zero targets.

Who can participate;

Where there are known constraints on the electricity distribution network, National Grid wish to enter into contract with Flexible Service Providers (FSP's) which will allow us to utilise demand and generate flexibility in return for financial payment.

We work with a number of different of FSPs. Examples include;

- 1. Residential demand response through assets such as EV charge points and heat pumps through energy Suppliers and Aggregators.
- Industrial and commercial sites who can reduce their demand, switch to backup generation or generate energy to the grid.
- 3. Owners and operators of storage and generation such as battery energy storage site, gas turbines peaking assets and biomass.

Where We Buy Flexibility

National Grid highlight areas of requirement (Constraint Management Zones, CMZ's) where we want additional capacity on the network. We publish all our requirements data on National Grid's **Connected Data Portal** (CDP)

Links to Data Sets on CDP;

Dataset	Low Voltage Zones	High Voltage Zones
Postcode and polygon data; to match your assets to our Zones	Click here	Click here
Ceiling prices; maximum price you can bid to		Click here
Requirement volumes; how much we need	Click here	Click here
Requirement profiles; when we need it		Click here

In addition, we also publish;

An Interactive
Map of the
flexibility
locations that are
currently open for
procurement

An Interactive
Signposting Map
that shows all
locations where
we may seek
flexibility in the
future

A postcode
checker which
will give an
indication of if a
site is within a
flexibility location

What Flexibility We Buy

National Grid is procuring flexibility across four products, each product has a specific use case,

Sustain

Our Sustain service is is a scheduled constraint management service with fixed delivery periods. It offers a utilisation only payment.

Secure

Our Secure service is used to manage peak demand loading on the network and preemptively reduce network loading. It offers a higher availability payment and lower utilisation payment.

Dynamic

Our Dynamic service has been developed to support the network in the event of specific fault conditions, such as during maintenance work. It offers a low availability payment and higher utilisation payment.

Restore

Our Restore service supports power restoration following rare fault conditions. No availability payment, instead it offers a premium utilisation payment

Ceiling Prices and Average Earnings;

We publish the ceiling prices associated with our flexibility requirements on our <u>Connected Data Portal</u>. Below are some examples of the ceiling prices we procured against in 2023/24

Product Ceiling Price		Average	Fixed Price
Secure £3005/MWh		£1045/MWh	
Dynamic	£8584/MWh	£2936/MWh	
Sustain £1079/kW/delivery £68/kW/delivery		£68/kW/delivery	
	period	period	
Restore N/A		N/A	£1200/MWh

When We Buy Flexibility

We procure flexibility across two timeframes, Short Term and Long Term.

Short Term Opportunities;

These are procured a week ahead for delivery the following week.

Every Thursday From midday	Short Term Trade Opportunities for FSPs open for bids
Every Tuesday By midnight	Deadline for Trade Responses
Every Thursday By midday	Trade Awards announced for delivery from the next Monday

Long Term Opportunities;

These are procured once a year, for delivery over a 12 month period.

In August (exact date announced via our Engagement and Procurement Timetable)	Publish flexibility locations and requirements for; Long Term Dynamic Long Term Secure Sustain Restore to the Connected Data Portal
+4 weeks	Trade Opportunities for FSPs open on the Market Gateway
+6 weeks	Deadline for Trade Responses. Launch date +6 weeks
+4 weeks	Trade Awards announced

Please see our **Engagement and Procurement Timetable** for full details

How We Buy Flexibility

National Grid procures through its online portal, <u>Market Gateway.</u> To provide Flexibility FSP's will need to register and complete pre-qualification to allow entry into Trades.

There are four steps to the Trade process, which are outlined below;

Start Commercial Qualification	Next Step Technical Qualification	Next Step Trades	Next Step Delivery
Register on Market Gateway	Access to Asset Registration	Complete the Trade Response	Deliver Flex Services – optimal dispatch start/start
2. Digitally sign Overarching Contract	2. Register assets through the Market Gateway Interface or via the API	 Respond to any clarifications Trade Award 	signals over API 2. Submit metering for MUs over API or
3. Complete Billing Form	Assign Assets to a Meterable Unit	decision issued 4. Trade visible on	through upload 3. Performance/
4. Receive Award Letter	(MU) 4. Prove Metering	Flexible Power Portal	earnings reports and Invoices available to
5. Complete Flexible Power Portal Account Request Form			view in Flexible Power Portal

Following on from <u>Market Gateway</u> registration and qualification, FSP's will then be given access to the Flexible Power Portal, which facilitates;

- 1. **Trades** (Submitting and viewing trades)
- 2. **Operation** (receiving stop/start signals and submitting event metering)
- 3. **Settlement** (view performance and earning statements and view and approve invoices)

How We Calculate Earnings

The delivery of Flexibility Services is settled monthly. Self-billing invoices, along with and performance and earning statements for every delivery event are produced in the Flexible Power Portal for flexibility providers to review.

Payments are split into two separate parts: Availability and Utilisation. Availability Payments are paid for every Accepted Availability Window. Utilisation Payments are made for every instance of Utilisation

Availability

Availability represents a "payment of readiness". This means that payments are made for being ready to respond to a dispatch instruction requesting delivery. Availability payments can be recovered should the delivered capacity be lower than the contracted capacity.

Utilisation

Utilisation is a payment made for delivery of flexibility after the dispatch instruction. The response to a dispatch instruction is expected within 15 minutes. Payments for Utilisation are subject to a grace factor and an under delivery penalisation multiplier for every 1% of delivery below the grace factor.

Secure and Dynamic services are subject to both Availability Payments and Utilisation Payments.

Sustain and Restore services are subject to the Utilisation Payment only.

Attribute	Dynamic	Secure	Sustain	Restore
Grace Factor	5%	5%	5%	10%
Penalisation Multiplier	3	3	3	1 for delivery between 80% and 100% and 2 for delivery under 80%
Payable Over Delivery	0%	0%	0%	10%

For more information on our Payment Mechanic, you can read our published document here

Baselines

Baselines are fundamental to the delivery of flexibility services, they;

- set the level of delivery expectation
- set the level for delivery verification
- allow delivery quantification enable settlement of services

The FSP must register its assets through the <u>Market Gateway</u> and receive confirmation of their validity before their applicable baseline option(s) is confirmed. We reserve the right to update the baseline options and the methodology for the calculations.

There are four types of baseline currently available;

- 1. Zero
- 2. Asset capacity
- 3. Self-nominated based on historic demand
- 4. Based on planning profiles.

Please see our **Baselines Values Spreadsheet** for further detail

Asset Scale	Response Type	Metering Location	Baseline
Industrial OR Commercial	Generation	Any	Zero
Industrial OR Commercial	Stored Energy	Any	Asset Capacity
Industrial OR Commercial	Demand	Any	Self-Nominated
Domestic	Demand	Any	Baseline calculated by NGED based on Planning Profiles. Calculated Baselines=Capacity
Domestic	Stored Energy	Any	Baseline calculated by NGED based on Planning Profiles. Calculated Baselines=Capacity
Domestic	Generation	DER Level	Zero
Domestic	Generation	Point of Connection	Baseline calculated by NGED based on Planning Profiles. Calculated Baselines=Capacity

Answers to Common Questions

Below are a series of common questions with answers surrounding Flexibility.

Question	Answer
Are there any specific technology types that NGED contract with?	We work with any technology that can provide a response, either through demand reduction or generation turn up
Are there minimum or maximum asset sizes that can participate?	No, we will work with assets of any size
Are distribution level flexibility services stackable?	We do not impose any exclusivity on our services so where other services allow, you can stack. Improving service stacking is a subject of ongoing work across the industry, see our recent work on this
